

8 STEPS TO MAKING safe passwords

01. Memorable

Create passwords that you can memorize. Complex passwords are not always the best since they can be difficult to memorize.

There is no need to change your passwords every few months. This makes it more difficult to remember your password.

02. Keep it.

03. Managers

Use a password manager app or something like Google passwords. Therefore, you only need to memorize one password.

It is ok to write down your passwords as long as it is in a safe and secure location where it cannot be easily picked up.

04. Write it down.

05. Check on it.

Use something like Google Password Checkup to see if any of your passwords have been subject to a data breach.

Avoid using common words or phrases as these are easy to guess. Make sure your password is at least eight characters.

06. No Common Phrases

07. No recycling

Do not recycle the same password or modify a root password. If one breach occurs, it will be easier to hack other accounts.

Use a multifactor authentication app to make accounts more secure. Avoid text message or call authentication methods.

08. Authentication Apps

CYBERSECURITY

Confidentiality

Integrity

Availability

Passwords are an essential part of cybersecurity. They keep your data confidential from outsiders and available to you. Because of this, it also supports maintaining the integrity of your data. They also help protect your online reputation from bad actors.
